# (54) Title: N-SUBSTITUTED PYRROLIDIN DERIVATIVES AS DIPEPTIDYL PEPTIDASE IV INHIBITORS

(57) Abstract: The present invention relates to compounds of formula (I), wherein R<sup>1</sup>, R2, and X are as defined in the description and claims, and pharmaceutically acceptable salts thereof. The compounds are useful for the treatment and/or prophylaxis of diseases which are associated with DPP IV, such as diabetes, particularly non-insulin dependent diabetes mellitus, and impaired glucose tolerance.

The enzyme dipeptidyl peptidase IV (EC.3.4.14.5, abbreviated in the following as DPP-IV) is involved in the regulation of the activities of several hormones. In particular DPP-IV is degrading efficiently and rapidly glucagon like peptide 1 (GLP-1), which is one of the most potent stimulator of insulin production and secretion. Inhibiting DPP-IV would potentiate the effect of endogenous GLP-1, and lead to higher plasma insulin concentrations. In patients suffering from impaired glucose tolerance and type 2 diabetes mellitus, higher plasma insulin concentration would moderate the dangerous hyperglycaemia and accordingly reduce the risk of tissue damage. Consequently, DPP-IV inhibitors have been suggested as drug candidates for the treatment of impaired glucose tolerance and type 2 diabetes mellitus (e.g. Vilhauer, WO98/19998). Other related state of the art can be found in WO 99/38501, DE 19616486, DE 19834591, WO 01/40180, WO 01/55105, US 6110949, WO 00/34241 and US6011155.

We have found novel DPP-IV inhibitors that very efficiently lower plasma glucose levels. Consequently, the compounds of the present invention are useful for the treatment and/or prophylaxis of diabetes, particularly non-insulin dependent diabetes mellitus, and/or impaired glucose tolerance, as well as other conditions wherein the amplification of action of a peptide normally inactivated by DPP-IV gives a therapeutic benefit. Surprisingly, the compounds of the present invention can also be used in the treatment and/or prophylaxis of bowl disease, colitis ulcerosa, morbus crohn, obesity and/or metabolic syndrome. Unexpectedly, the compounds of the present invention exhibit improved therapeutic and pharmacological properties compared to other DPP IV inhibitors known in the art, such as e.g. in context with pharmacokinetics and bioavailability.

Unless otherwise indicated, the following definitions are set forth to illustrate and define the meaning and scope of the various terms used to describe the invention herein.

In this specification the term "lower" is used to mean a group consisting of one to seven, preferably of one to four carbon atom(s).

The term "halogen" refers to fluorine, chlorine, bromine and iodine, preferably to fluorine and chlorine.

The term "alkyl", alone or in combination with other groups, refers to a branched or straight-chain monovalent saturated aliphatic hydrocarbon radical of one to twenty carbon atoms, preferably one to sixteen carbon atoms, more preferably one to ten carbon atoms. Alkyl groups can optionally be substituted e.g. with halogen, hydroxy, lower-alkoxy, lower-alkoxy-carbonyl, NH<sub>2</sub>, N(H, lower-alkyl) and/or N(lower-alkyl)<sub>2</sub>. Unsubstituted alkyl groups are preferred.

The term "lower-alkyl", alone or in combination with other groups, refers to a branched or straight-chain monovalent alkyl radical of one to seven carbon atoms, preferably one to four carbon atoms. This term is further exemplified by such radicals as methyl, ethyl, n-propyl, isopropyl, n-butyl, s-butyl, t-butyl and the like. A lower-alkyl group may optionally have a substitution pattern as described earlier in connection with the term "alkyl". Unsubstituted lower-alkyl groups are preferred.

The term "alkoxy" refers to the group R'-O-, wherein R' is alkyl. The term "lower-alkoxy" refers to the group R'-O-, wherein R' is lower-alkyl. Examples of lower-alkoxy groups are e.g. methoxy, ethoxy, propoxy, isopropoxy, butoxy, isobutoxy and hexyloxy. Alkoxy and lower-alkoxy groups may optionally have a substitution pattern as described earlier in connection with the term "alkyl". Unsubstituted alkoxy and lower-alkoxy groups are preferred.

20

35

The term "aryl" relates to the phenyl or naphthyl group, preferably the phenyl group, which can optionally be mono- or multiply-substituted by lower-alkyl, lower-alkoxy, halogen, CN, CF<sub>3</sub>, hydroxy, NO<sub>2</sub>, NH<sub>2</sub>, N(H, lower-alkyl), N(lower-alkyl)<sub>2</sub>, carboxy, aminocarbonyl, phenyl, benzyl, phenoxy, and/or benzyloxy. Preferred substituents are lower-alkyl, lower-alkoxy, halogen, CN, and/or CF<sub>3</sub>.

The term "heteroaryl" refers to an aromatic 5- or 6-membered ring which can comprise 1, 2 or 3 atoms selected from nitrogen, oxygen and/or sulphur such as furyl, pyrrolyl, pyridyl, 1,2-, 1,3- and 1,4-diazinyl, thienyl, oxazolyl, oxadiazolyl, isoxazolyl, thiazolyl, isothiazolyl or imidazolyl. A heteroaryl group may optionally have a substitution pattern as described earlier in connection with the term "aryl".

The term "5-membered heteroaryl" refers to an aromatic 5-membered ring which can comprise 1 to 4 atoms selected from nitrogen, oxygen and/or sulphur such as furyl, thienyl, pyrrolyl, imidazolyl, oxazolyl, isoxazolyl, thiazolyl, isothiazolyl, oxadiazolyl such as 1,3,4- and 1,2,4-oxadiazolyl, triazolyl or tetrazolyl. Preferred 5-membered heteroaryl groups are oxazolyl, imidazolyl, pyrazolyl, triazolyl, 1,3,4- and 1,2,4-oxadiazolyl and thiazolyl. A 5-membered heteroaryl group can optionally be substituted with lower-alkyl, lower-alkoxy, halogen, CN, CF<sub>3</sub>, trifluoroacetyl, aryl, heteroaryl, and carbonyl, which carbonyl group can optionally be substituted with lower-alkyl, lower-alkoxy, halogen, CN, CF<sub>3</sub>, aryl, or heteroaryl.

The term "monocyclic heterocyclyl" refers to non aromatic monocyclic heterocycles with 5 or 6 ring members, which comprise 1, 2 or 3 hetero atoms selected from nitrogen, oxygen and sulfur. Examples of suitable monocyclic heterocyclyl groups are piperidinyl and morpholinyl. A monocyclic heterocyclyl may be substituted with lower-alkyl.

The term "bi- or tricyclic heterocyclyl" refers to bicyclic or tricyclic aromatic groups comprising two or three 5- or 6-membered rings, in which one or more rings can comprise 1, 2 or 3 atoms selected from nitrogen, oxygen and/or sulphur, and which can be partially hydrogenated. Examples of bi- or tricyclic heterocyclyl groups are e.g. indolyl, aza-indolyl such as 2-, 3-, 4-, 5-, 6- or 7-aza-indolyl, indolinyl carbazolyl, benzothiophenyl, benzothiazolyl, benzooxazolyl, benzimidazolyl, 4,5,6,7-tetrahydrothiazolo[5,4-c]pyridinyl, 4,5,6,7-tetrahydro-benzthiazolyl, 8H-indeno[1,2-d]thiazolyl and quinolinyl. Preferred bi- or tricyclic heterocyclyl groups are benzothiazolyl and 4,5,6,7-tetrahydro-thiazolo[5,4-c]pyridinyl. A bi- or tricyclic heterocyclyl group can optionally have a substitution pattern as described earlier in connection with the term "5-membered heteroaryl".

The term "pharmaceutically acceptable salts" embraces salts of the compounds of

Compounds of formula (I) can have one or more asymmetric carbon atoms and can exist in the form of optically pure enantiomers or as racemates. The invention embraces all of these forms.

It will be appreciated, that the compounds of general formula (I) in this invention may be derivatised at functional groups to provide derivatives which are capable of conversion back to the parent compound in vivos and group brother much acety.

The present invention also relates to a process for the manufacture of compounds of formula (I) as defined above, which process comprises reacting a compound of formula (II)

15

with a compound R<sup>2</sup>-NH<sub>2</sub>, wherein R<sup>1</sup>, R<sup>2</sup> and X are as defined above and Y is a leaving group, to yield said compound of formula (I), and optionally converting the compound of formula (I) to a pharmaceutically acceptable salt. Preferred is a process as described above, in which Y is halogen, mesylate or tosylate, more preferably chlorine or bromine.

In general, a compound of formula (II) is treated with one to five equivalents of a compound R<sup>2</sup>-NH<sub>2</sub>, in the optional presence of an additional base such as a tertiary amine, a carbonate or a hydroxide at a temperature ranging from -78° to 70° in an inert solvent such as THF or DMF for 0.1 to 7 days and the resulting compound of formula (I) is isolated by standard isolation procedures. Optionally, the resulting compound of formula (I) can be converted to a salt (acid addition salt) using methods known to the person skilled in the art.

The invention further relates to compounds of formula (I) as defined above, when manufactured according to a process as defined above.

10 35 B. C.

As described above, the compounds of formula (I) of the present invention can be used as medicaments for the treatment and/or prophylaxis of diseases which are associated with DPP IV such as diabetes, particularly non-insulin dependent diabetes mellitus, impaired glucose tolerance, bowl disease, colitis ulcerosa, morbus crohn, obesity, and/or metabolic syndrome, preferably non-insulin dependent diabetes mellitus and/or impaired glucose tolerance. Furthermore, the compounds of the present invention can be used as diuretic agents or for the treatment and/or prophylaxis of hypertension.

The invention therefore also relates to pharmaceutical compositions comprising a compound as defined above and a pharmaceutically acceptable carrier and/or adjuvant.

Further, the invention relates to compounds as defined above for use as therapeutic active substances, particularly as therapeutic active substances for the treatment and/or prophylaxis of diseases which are associated with DPP IV such as diabetes, particularly non-insulin dependent diabetes mellitus, impaired glucose tolerance, bowl disease, colitis ulcerosa, morbus crohn, obesity, and/or metabolic syndrome, preferably for use as therapeutic active substances for the treatment and/or prophylaxis of non-insulin dependent diabetes mellitus and/or impaired glucose tolerance. The invention relates furthermore to compounds as defined above for use as diuretic agents or for use as therapeutic active substances for the treatment and/or prophylaxis of hypertension.

In another embodiment, the invention relates to a method for the treatment and/or prophylaxis of diseases which are associated with DPP IV such as diabetes, particularly non-insulin dependent diabetes mellitus, impaired glucose tolerance, bowl disease, colitis ulcerosa, morbus crohn, obesity, and/or metabolic syndrome, preferably for the treatment and/or prophylaxis of non-insulin dependent diabetes mellitus and/or impaired glucose tolerance, which method comprises administering a compound as defined above to a human being or animal. The invention relates furthermore to a method for the treatment and/or prophylaxis as defined above, wherein the disease is hypertension or wherein a diuretic agent has a beneficial effect.

The invention further relates to the use of compounds as defined above for the treatment and/or prophylaxis of diseases which are associated with DPP IV such as diabetes, particularly non-insulin dependent diabetes mellitus, impaired glucose tolerance, bowl disease, colitis ulcerosa, morbus crohn, obesity, and/or metabolic syndrome, preferably for the treatment and/or prophylaxis of non-insulin dependent diabetes mellitus and/or impaired glucose tolerance. The invention relates furthermore to the use as defined above, wherein the disease is hypertension or to the use as diuretic agent.

In addition, the invention relates to the use of compounds as defined above for the

ar garage the tra

preparation of medicaments for the treatment and/or prophylaxis of diseases which are associated with DPP IV such as diabetes, particularly non-insulin dependent diabetes mellitus, impaired glucose tolerance, bowl disease, colitis ulcerosa, morbus crohn, obesity, and/or metabolic syndrome, preferably for the treatment and/or prophylaxis of non-insulin dependent diabetes mellitus and/or impaired glucose tolerance. Such medicaments comprise a compound as defined above. The invention relates furthermore to the use as defined above, wherein the disease is hypertension or the use for the preparation of diuretic agents.

In context with the methods and uses defined above, the following diseases relate to a preferred embodiment: diabetes, particularly non-insulin dependent diabetes mellitus; impaired glucose tolerance, obesity, and/or metabolic syndrome, preferably non-insulin dependent diabetes mellitus and/or impaired glucose tolerance and/or metabolic syndromes.

The compounds of formula (I) can be manufactured by the methods given below, by the methods given in the examples or by analogous methods. Appropriate reaction conditions for the individual reaction steps are known to the person skilled in the art. Starting materials are either commercially available or can be prepared by methods analogous to the methods given below or in the examples or by methods known in the art.

The following tests were carried out in order to determine the activity of the compounds of formula I.

Activity of DPP-IV inhibitors are tested with natural human DPP-IV derived from a human plasma pool or with recombinat human DPP-IV. Human citrate plasma from different donors is pooled, filterted through a 0.2 micron membrane under sterile conditions and aliquots of 1 ml are shock frozen and stored at –120°C until used. In the colorimetric DPP-IV assay 5 to 10 µl human plasma and in the fluorometric assay 1.0 µl of human plasma in a total assay volume of 100 µl is used as an enzyme source. The cDNA of the human DPP-IV sequence of amino acid 31 – to 766, restricted for the N-terminus and the transmembrane domain, is cloned into pichia pastoris. Human DPP-IV is expressed and purified from the cultur medium using conventional column chromatography including size exclusion and anion and cation chromatography. The purity of the final enzyme preparation of Coomassie blue SDS-PAGE is > 95 %. In the colorimetric DPP-IV assay 20 ng rec.-h DPP-IV and in the fluorometric assay 2 ng rec-h DPP-IV in a total assay volume of 100 µl is used as an enzyme source.

In the fluorogenic assay Ala-Pro-7-amido-4-trifluoromethylcoumarin (Calbiochem No 125510) is used as a substrate. A 20 mM stock solution in 10 % DMF/ $H_2O$  is stored at - 20°C until use. In IC50 determinations a final substrate concentration of 50  $\mu$ M is used. In

assays to determine kinetic parameters as Km, Vmax, Ki, the substrate concentration is varied between  $10\,\mu\text{M}$  and  $500\,\mu\text{M}$ .

In the colorimetric assay H-Ala-Pro-pNA.HCl (Bachem L-1115) is used as a substrate. A 10 mM stock solution in 10% MeOH/H<sub>2</sub>O is stored at -20oC until use. In IC50 determinations a final substrate concentration of 200 µM is used. In assays to determine kinetic parameters as Km, Vmax, Ki, the substrate concentration is varied between 100 µM and 2000 µM. Fluorescence is detected in a Perkin Elmer Luminescence Spectrometer LS 50B at an excitation wavelength of 400 nm and an emission wavelength of 505 nm continuously every 15 seconds for 10 to 30 minutes. Initial rate constants are calculated by best fit linear regression. The absorption of pNA liberated from the colorimetric substrate is detected in a Packard SpectraCount at 405 nM continuosly every 2 minutes for 30 to 120 minutes. Initial rate constants are calculated by best fit linear regression.

DPP-IV activity assays are performed in 96 well plates at 37°C in a total assay volume of 100 µl. The assay buffer consists of 50 mM Tris/HCl pH 7.8 containing 0.1 mg/ml BSA and 100 mM NaCl. Test compounds are solved in 100 % DMSO, diluted to the desired concentration in 10% DMSO/H<sub>2</sub>O. The final DMSO concentration in the assay is 1 % (v/v). At this concentration enzyme inactivation by DMSO is < 5%. Compounds are with (10 minutes at 37°C) and without preincubation with the enzyme. Enzyme reactions are started with substrate application follwed by immediate mixing.

IC50 determinations of test compounds are calculated by non-linear best fit regression of the DPP-IV inhibition of at least 5 different compound concentrations. Kinetic parameters of the enzyme reaction are calculated at at least 5 different substrate concentrations and at least 5 different test compound concentrations.

The preferred compounds of the present invention exhibit IC50 values of 1 nM to 10 μM, more preferrably of 1 4 100 nM; as shown in the following table.

The compounds of formula I and/or their pharmaceutically acceptable salts can be used as medicaments, e.g. in the form of pharmaceutical preparations for enteral, parenteral or topical administration. They can be administered, for example, perorally, e.g. in the form of tablets, coated tablets, dragées, hard and soft gelatine capsules, solutions, emulsions or suspensions, rectally, e.g. in the form of suppositories, parenterally, e.g. in the form of injection solutions or infusion solutions, or topically, e.g. in the form of ointments, creams or oils. Oral administration is preferred.

The production of the pharmaceutical preparations can be effected in a manner which will be familiar to any person skilled in the art by bringing the described

compounds of formula Fand/or their pharmaceutically acceptable salts, optionally in combination with other therapeutically valuable substances, into a galenical adjunction of the compounds of formula formu

Suitable carrier materials are not only inorganic carrier materials, but also organic carrier materials. Thus, for example, lactose, corn starch or derivatives thereof, talc, stearic acid or its salts can be used as carrier materials for tablets, coated tablets, dragées and hard gelatine capsules. Suitable carrier materials for soft gelatine capsules are, for example, vegetable oils, waxes, fats and semi-solid and liquid polyols (depending on the nature of the active ingredient no carriers might, however, be required in the case of soft gelatine capsules). Suitable carrier materials for the production of solutions and syrups are, for example, water, polyols, sucrose, invert sugar and the like. Suitable carrier materials for injection solutions are, for example, water, alcohols, polyols, glycerol and vegetable oils. Suitable carrier materials for suppositories are, for example, natural or hardened oils, waxes, fats and semi-liquid or liquid polyols. Suitable carrier materials for topical preparations are glycerides, semi-synthetic and synthetic glycerides, hydrogenated oils, liquid waxes, liquid paraffins, liquid fatty alcohols, sterols, polyethylene glycols and cellulose derivatives.

Usual stabilizers, preservatives, wetting and emulsifying agents, consistencyimproving agents, flavour-improving agents, salts for varying the osmotic pressure, buffer substances, solubilizers, colorants and masking agents and antioxidants come into consideration as pharmaceutical adjuvants.

The dosage of the compounds of formula I can vary within wide limits depending on the disease to be controlled, the age and the individual condition of the patient and the mode of administration, and will, of course, be fitted to the individual requirements in each particular case. For adult patients a daily dosage of about 1 to 1000 mg, especially

about 1 to 100 mg, comes into consideration. Depending on severity of the disease and the precise pharmacokinetic profile the compound could be administered with one or several daily dosage units, e.g. in 1 to 3 dosage units.

The pharmaceutical preparations conveniently contain about 1-500 mg, preferably 1-100 mg, of a compound of formula I.

The compounds of formula (I) can be manufactured by the methods given below, by the methods outlined in the examples or by analogous methods.  $\alpha$ -Haloamides (II) were made from (S)-prolylamide in analogy to procedures described in WO 98/19998. Starting amines of the general formula (III) are commercially available or can be prepared by methods found in the literature or according to the methods given below and within the example section (e.g. IIIA-IIIT). In general, an  $\alpha$ -haloamide II is treated with one to five equivalents of an amine III, in the optional presence of an additional base such as a tertiary amine, a carbonate or a hydroxide, at a temperature ranging from  $-78^{\circ}$  to  $70^{\circ}$  in an inert solvent such as THF or DMF for 0.1 to 7 days and the resulting product I is isolated by standard isolation procedures. Optionally, an acid addition salt can be made using methods known to people skilled in the art. Compounds in which X = S can be made either by analogous methods or by methods known to the person skilled in the art.

Compounds of the formula (I) wherein X is  $C(R^8,R^9)$  and  $R^8,R^9$  are independently from each other lower alkyl can be obtained from suitable protected glutamic acid analogues by alkylation and subsequent cyclisation to proline derivatives. These can further be elaborated to the  $\alpha$ -haloamides II in an analogue fashion as described for (S)-prolylamide.

Compounds of the formula (I) wherein R<sup>2</sup> is -C(R<sup>3</sup>,R<sup>4</sup>)-CH<sub>2</sub>-NH-R<sup>6</sup> might require the synthesis of the corresponding amine precursors IIIE, IIIF, IIIN, IIIO and IIIP.

Preparation of these amine derivatives is described in the general schemes below:

# Scheme 1:

X = CH or N

Amine derivatives IIIE can be prepared by the reaction of a dibromo-pyridine or pyrimidine derivative XIII with the appropriate 1,2-diaminoethane to form XIV. Subsequently, IIIE can be obtained by reaction of XIV with an appropriate phenyl or heteroaryl derivative in a Suzuki type reaction.

#### 5 Scheme 2:

Amine derivatives IIIF can be prepared by the reaction of an optionally protected (2-amino-ethyl)-thiourea XV with an  $\alpha$ -halo-carbonyl compound to form the corresponding N1-thiazol-2-yl-ethane-1,2-diamine XVI. Finally, deprotection leads to IIIF. The starting thiourea XV is known [R<sub>3</sub> = R<sub>4</sub> = H: CAS 331779-96-5] or can be derived in analogy from the corresponding diamine and benzoyl isothiocyanate.

Amine derivatives IIIN can be obtained if a chloro-benzthiazole, -benzoxazole, or -imidazole XXXI is treated with the appropriate 1,2-diaminoethane.

# receptor receive and equipartition to the property of the section of the section

Amine derivatives IIIO can be obtained if 2-chloro-[1,3,4]oxadiazoles XXXII are treated with the appropriate 1,2-diaminoethanes. Starting [1,3,4]oxadiazoles are known or could be prepared in analogy to literature procedures (e.g. Singh, H. et al. Ind. J. Chem., 1983, 22, 1177-1178 and Golfier, M. J. Heterocycl. Chem., 1973, 10, 989).

Scheme 5

Amine derivatives IIIP can be obtained from nitrile derivatives XXXIII by conversion to the corresponding hydroxy-amidines XXXIV and subsequent cyclisation in the presence of trichloracetic anhydride and trichloracetic acid to the [1,2,4] oxadiazoles XXXV which are treated with the appropriate 1,2 diaminoethane.

Compounds of the formula (I) wherein R<sup>2</sup> is  $-C(R^3, R^4)$ - $(CH_2)_n$ - R<sup>5</sup> might require the synthesis of the corresponding amine precursors IIIA, IIIC, IIID, IIIG, IIIH, IIIK, IIIL, IIIM, IIIQ, IIIR, IIIS and IIIT. Preparation of these amine derivatives is described in the general schemes below:

Scheme 6:

Amine derivatives IIIA can be obtained by reaction of indole derivatives V with a sulfimidate IV yielding intermediates VI that can subsequently be deprotected. Intermediates VI can optionally be reduced prior to the deprotection step. Sulfimidates represented by the general formula IV can be made from the suitably substituted α-amino acid. This starting material is reduced by methods known in the literature to give the corresponding 2-amino-alcohol. The intermediate thus obtained is then converted to the N-BOC protected derivative by standard methods. Further treatment with SOCl<sub>2</sub>/imidazole and subsequent oxidation with NaIO<sub>4</sub>/RuO<sub>2</sub> affords the desired sulfimidate IV.

Scheme 7:

- 36 -

Amine derivatives IIIC can be obtained from substituted aromatic bromides or iodides IX that are lithiated and further treated with a sulfimidate IV to yield the BOC protected intermediates X. These are then deprotected using methods known in the literature (Greene, T. W. et al. Protective Groups in Organic Synthesis; John Wiley &Sons, Inc.: New York, Chichester, Brisbane, Toronto, Singapore, 1991).

# Scheme 8:

$$\begin{array}{c|c} & & & \\ &$$

Amine derivatives IIID can be obtained by conversion of ethanol derivatives XI to the azide derivatives XII and subsequent reduction. The starting ethanol derivatives are known or were prepared from amides or thioamides in analogy to the procedures described in the literature (WO 00/08002 or Collins, J. L. et al. J. Med. Chem. 1998, 41, 5037-5054).

Amine derivatives IIIG can be obtained starting from the appropriate substituted halomethyl oxazole or thiazole derivatives XVII. Ester alkylation and subsequent saponification yielded the acid intermediates XVIII. These are subjected to a Curtius

rearrangement. A final deprotection step resultes in the formation of the amines IIIG. Amine derivatives IIIT can be obtained from imidazoles XL by chlorination, reaction with aliphatic nitro compounds under basic conditions (as for example described in Eur. J. Med.Chem. 1995, 30, 219-225) and subsequent reduction of the nitro intermediates XLI. Prior to the final reduction to the amine derivatives IIIT an N-alkylation step is optionally. Imidazoles XL are known or could be prepared from amidines XXXVI by reaction with 2,3-butadione or 1,3-dihydroxyacetone as described the literature (WO 96/10018 or in DE2528640).

Compounds of the formula (I) wherein R<sup>2</sup> is -C(R<sup>3</sup>,R<sup>4</sup>)-CH<sub>2</sub>-O-R<sup>7</sup> might require the synthesis of the corresponding amine precursors IIIB. Preparation of these amine derivatives is described in the general scheme below:

### General Remarks:

<sup>1</sup>H-NMR spectra were measured at 250 or 300 MHz in the solvent indicated in the example section. Chemical shifts are given in ppm relative to TMS. The remark (+Rotamer) indicates the presence of a second less intensive signal set in the spectrum that can be attributed to the rotamer. Mass spectra were taken with the ionization method indicated in the example section.

Racemic 1-amino-1,2,3,4-tetrahydronaphtalene (330 mg) was dissolved in dry THF (6 mL) under argon. A solution of IIA (130 mg) dissolved in 6 mL THF was added dropwise over a period of 5 hours at RT and the mixture was allowed to stir for another 20 hours. The resulting suspension was diluted with ethyl acetate and washed with saturated NaHCO<sub>3</sub> solution and brine. The organic layer was separated, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and evaporated. The residue was purified by flash chromatography (CH<sub>2</sub>Cl<sub>2</sub>/MeOH/NH<sub>4</sub>OH 95:5:0.5) and the appropriate fractions were combined and

evaporated to give the desired product as a mixture of two diastereomers (166 mg) as an oil.

# (2S)-1-{[(1S)-2-(5-Methoxy-2-methyl-indol-1-yl)-1-methyl-ethylamino]-acetyl}-pyrrolidine-2-carbonitrile, hydrochloride salt

Synthesis of this compound requires the preparation of the corresponding amine precursor IIIA according to the general scheme shown above. In the initial step, an indole or indoline derivative V is treated with a suitable base such as NaH or potassium tert butylate in an inert solvent such as THF or DMF or the like and then with a sulfimidate IV to give intermediate VI. Sulfimidates represented by the general formula IV can be made from the suitably substituted α-amino acid. This starting material is reduced by methods known in the literature to give the corresponding 2-amino-alcohol. The intermediate thus obtained is then converted to the N-BOC protected derivative by standard methods. Further treatment with SOCl<sub>2</sub>/imidazole and subsequent oxidation with NaIO<sub>4</sub>/RuO<sub>2</sub> affords the desired sulfimidate IV.

At this stage, reduction of the indole nucleus to the corresponding indoline can be carried out optionally by reduction with NaCNBH3 or the like. The BOC protected intermediate VI is then deprotected using methods known in the literature (Greene, T. W. et al. Protective Groups in Organic Synthesis; John Wiley &Sons, Inc.: New York, Chichester, Brisbane, Toronto, Singapore, 1991) such as TFA/CH2Cl2 or HCl and the amine IIIA is liberated from its salt by base treatment.

(S)-4-Methyl-2,2-dioxo-[1,2,3]oxathiazolidine-3-carboxylic acid tert-butyl ester IV (1.42 g) was added in one portion and stirring was continued at RT until TLC analysis showed complete consumption of the starting material. The reaction mixture was partitioned between ether and saturated NH<sub>4</sub>Cl solution and the organic layer was separated, washed with sat. (2S)-1-{[(1S)-1-Methyl-2-(naphthalen-2-yloxy)-ethylamino]-acetyl}-pyrrolidine-2-carbonitrile

Synthesis of this compound requires the preparation of the corresponding amine precursor IIIB according to the general scheme shown above. In the initial step, an aminophenol or naphtol derivative VII is treated with a suitable base such as NaH or potassium ten butylate in an inert solvent such as THF or DMF or the like and then with a sulfimidate IV: Sulfimidates represented by the general formula IV can be made from the suitably substituted α-amino acid. This starting material is reduced by methods known in the literature to give the corresponding 2-amino-alcohol. The intermediate thus obtained is then converted to the N-BOC protected derivative by standard methods. Further treatment with SOCl<sub>2</sub>/imidazole and subsequent oxidation with NaIO<sub>4</sub>/RuO<sub>2</sub> affords the desired sulfimidate IV.

The resulting BOC protected intermediate VIII is then deprotected using methods known in the literature (Greene, T. W. et al. Protective Groups in Organic Synthesis; John Wiley &Sons, Inc.: New York, Chichester, Brisbane, Toronto, Singapore, 1991) such as TFA/CH<sub>2</sub>Cl<sub>2</sub> or HCl and the amine IIIBis liberated from its salt by base treatment.

# (2S)-1-{[2-(quinolin-6-yloxy)-ethylamino]-acetyl}-pyrrolidine-2-carbonitrile

This compound was obtained in analogy to example 25, steps A] to C] from 6-hydroxyquinoline, 2,2-dioxo-[1,2,3]oxathiazolidine-3-carboxylic acid tert-butyl ester and IIB with the following modification in step B]: The amine intermediate obtained in this step was very water soluble and could not be isolated by extraction. The aqueous phase was therefore neutralized with solid NaHCO<sub>3</sub> and the solvent was removed in high vacuum. The resulting solid was suspended in ethanol, stirred for 1 hour and then filtered. The filtrate was concentrated in vacuo and the residue was purified by flash chromatography to give the free amine III that was used in the final coupling step.

Synthesis of this compound requires the preparation of the corresponding amine precursor IIIC according to the general scheme shown above. A substituted aromatic bromide or iodide IX is treated with BuLi in an inert solvent such as THF at low temperature (-100 to 0 °C). The lithiated species thus generated is then further treated with a sulfimidate IV and BOC protected intermediate X is obtained. Compound X is then deprotected using methods known in the literature (Greene, T. W. et al. Protective Groups in Organic Synthesis; John Wiley &Sons, Inc.: New York, Chichester, Brisbane, Toronto, Singapore, 1991) such as TFA/CH<sub>2</sub>Cl<sub>2</sub> or HCl and the amine with the general formula IIIC is liberated from its salt by base treatment.

4-Brom-N,N-dimethylaniline (1.0 g) was dissolved in dry THF (17 mL) and cooled to -78 deg with a dry ice/acetone bath. BuLi (1.6 M in hexanes, 3.75 mL) was added dropwise by means of a syringe and a colorless precipitate was observed after addition. The mixture was allowed to stir for 20 min and then (S)-4-methyl-2,2-dioxo-[1,2,3]oxathiazolidine-3-carboxylic acid tert-butyl ester (1.54 g) was added in one portion. The suspension was stirred at -78 deg for 30 mins and then the excess solid dry ice was removed and the mixture allowed to warm to -30 °C over a period of 60 min. The suspension gradually cleared to give a slightly hazy yellow solution. This was quenched by addition of saturated NH<sub>4</sub>Cl solution and extracted with CH<sub>2</sub>Cl<sub>2</sub> (heavy emulsion). The organic layer was washed with brine (emulsion) and dried over Na<sub>2</sub>SO<sub>4</sub>. The organic layer gradually turned dark blue. The solvent was removed in vacuo and the residue was purified by flash chromatography (CH<sub>2</sub>Cl<sub>2</sub> and then CH<sub>2</sub>Cl<sub>2</sub>/MeOH 95:5) to give the title compound as a light brown solid (563 mg).

Synthesis of this compound requires the preparation of the corresponding amine precursor IIID in three steps starting from ethanol derivative XI according to the general scheme above. Reaction of XI with i) methanesulfonyl chloride, ii) sodium azide and subsequent reduction of the azide derivative XII using either triphenylphosphine/water or hydrogen in presence of palladium/carbon resulted in the formation of amine IIID as the free base or its salt. The starting ethanol derivatives are known or were prepared from amides or thioamides in analogy to the procedures described in WO 00/08002 or Collins, I. L. et al. J. Med. Chem. 1998, 41, 5037-5054.

Step A]: 4-(2-Azido-ethyl)-5-methyl-2-phenyl-oxazole

2-(5-Methyl-2-phenyl-oxazol-4-yl)-ethanol [CAS 103788-65-4, commercially available] (2.1 g) and DIPEA (2.6 ml) were dissolved in CH<sub>2</sub>Cl<sub>2</sub> and the mixture was cooled to 0°C. Then methanesulfonyl chloride (0.85 ml) was added and stirring was continued for 4 hours at 0°C. After dilution with CH<sub>2</sub>Cl<sub>2</sub> the reaction mixture was washed with water and brine and the organic layer was dried with MgSO<sub>4</sub>. Filtration and evaporation of the solvent yielded a residue (2.81 g), which was redissolved in DMF (20 ml). Sodium azide (0.78 g) was added and the reaction mixture was heated to 60°C for 4 hours. Then water was added and the resulting mixture was extracted three times with ethyl acetate. The combined extracts were washed with water and brine and dried with MgSO<sub>4</sub>. After filtration and evaporation of the solvent the residue was purified by chromatography (hexane/ethyl acetate 1:1) to give the desired product as a light yellow oil (2.2 g).

Step B]: 4-(2-Amino-ethyl)-5-methyl-2-phenyl-oxazole

The azide derivative prepared according to step A] (5.25 g) was dissolved in a mixture of MeOH (200 ml) and conc. HCl (20 ml). Then a catalytic amount of 10%

- palladium/carbon was added and the reaction vessel was charged with hydrogen. After complete consumption of the starting material (as indicated by TLC), the catalyst was filtered off and most of the MeOH was removed from the filtrate. The remaining mixture was diluted with water, washed with ethyl acetate and the pH of the aqueous phase was then adjusted to 10 by addition of solid sodium carbonate. The aqueous phase was extracted three times with ethyl acetate and the combined organic layers were washed with brine and dried over MgSO<sub>4</sub>. Filtration and evaporation of the solvent yielded the title compound (4.6 g) as a brown solid.

Synthesis of this compound requires the preparation of the corresponding amine precursor IIIE. A possible way for the preparation of IIIE is described in the general scheme above. According to this scheme a dibromo-pyridine or pyrimidine derivative XIII is treated with the appropriate 1,2-diaminoethane. Subsequently, IIIE can be obtained by conversion of XIV with the appropriate phenyl derivative in a Suzuki type reaction.

Step A]: N1-(5-Bromo-pyridin-2-yl)-2-methyl-propane-1,2-diamine

A solution of 2,5-dibromopyridine (1.7 g) and pyridine (0.75 ml) in 1,2-diamino-2-methlypropane (8.5 ml) was heated 5 hours at 140°C. After cooling to RT, the solvent was evaporated. Step B]: N1-[5-(4-Methoxy-phenyl)-pyridin-2-yl]-2-methyl-propane-1,2-diamine

A solution of 4-methoxyphenylboronic acid (1.6 g) in EtOH (25 ml) and an aqueous solution of Na<sub>2</sub>CO<sub>3</sub> (6.3 g in 34 ml) were added to a solution of N1-(5-bromo-pyridin-2-yl)-2-methyl-propane-1,2-diamine (1.7 g) and tetrakis(triphenylphosphine)palladium(0) (0.81 g) in DME (50 ml). The mixture was stirred 6h at 85°C. The mixture was concentrated to approximately 20 ml. Ethyl acetate and 1N NaOH were added. After stirring 20 minutes insoluble parts were filtered off. The aqueous layer was extracted with ethyl acetate. The organic layers were washed with brine, combined, dried (MgSO<sub>4</sub>) and evaporated. Flash chromatography (silica gel; CH<sub>2</sub>Cl<sub>2</sub>/MeOH/NH<sub>4</sub>OH 80:19:1) followed by crystallization from ether and ethyl acetate provided 1.24 g of colorless crystals.

Example 47)

15 (2S)-1-{[2-(4,5-Dimethyl-thiazol-2-ylamino)-ethylamino]-acetyl}-pyrrolidine-2-carbonitrile

Synthesis of this compound requires the preparation of the corresponding amine precursor IIIF. A possible way for the preparation of IIIF is described in the general scheme above. According to this scheme an optionally protected (2-amino-ethyl)-thiourea XV is converted in the presence of an  $\alpha$ -halo-carbonyl compound to the corresponding N1-thiazol-2-yl-ethane-1,2-diamine XVI. Finally, deprotection leads to IIIF. The starting thiourea XV is known [R<sub>3</sub> = R<sub>4</sub> = H: CAS 331779-96-5] or can be derived in analogy from the corresponding diamine and benzoyl isothiocyanate.

Step A]: [2-(4,5-Dimethyl-thiazol-2-ylamino)-ethyl]-carbamic acid tert-butyl ester

A solution of (2-thioureido-ethyl)-carbamic acid tert-butyl ester [CAS 331779-96-5] (3.6 g), 3-bromo-2-butanone (2.45 g), and DIPEA (5.5 ml) in ethanol (100 ml) was stirred

overnight at RT and refluxed 1 hour. The mixture was concentrated. Ethyl acetate was added. Insoluble parts were filtered off and the remaining solution was extracted with brine. The organic layer was dried, evaporated and purified by flash chromatography yielding after crystallization 0.86 g of white crystals.

The solvent was evaporated. Ethyl acetate and 1N HCl were added. The separated aqueous layer was extracted under basic conditions with ethyl acetate. The obtained organic layer was washed with brine, dried (MgSO<sub>4</sub>) and evaporated yielding 0.42g of a light yellow oil.

For the synthesis of this compound the preparation of the corresponding amine precursor IIIG is required. A possible synthetic sequence is described in the general scheme above which started with the appropriate substituted halomethyl oxazole or thiazole derivative XVII. Ester alkylation i) and subsequent saponification ii) yielded the acid intermediate XVIII. This was subjected to a Curtius rearrangement iii) which could be conducted by diphenylphosphoryl azide. A final deprotection step iv) resulted in the formation of the amine IIIG as the free base or its salt. The starting materials XVII are known or were prepared in analogy to the procedures described in WO 01/19805 A1, US 545531, Chem. Pharm. Bull. 1971, 19, 2050-2057 and J. Med. Chem. 1972, 15, 419-420.

Step A]: 2,2-Dimethyl-3-(5-methyl-2-phenyl-oxazol-4-yl)-propionic acid

11

n-Buthyllithium (1.6M in hexane, 5.05 ml) was added dropwise to a solution of disopropylamine (1.16 ml) in THF (30ml) at 0°C under argon. The resulting mixture was 'stirred for another 15 minutes before it was cooled to -78? Cand a solution of methyl isobutyrate (0.84 ml) in THF (3 ml) was added dropwise. After the addition was scompleted, the reaction mixture was allowed to warm to 0°C and than again cooled to -478°C: At this temperature a solution of 4-chloromethyl-5-methyl-2-phenyl-oxazole [CAS \$103788-61-0, commercially available] (1.17g) in THF (6 ml) and DMPU (7.7 ml) was 20 ladded Stirring was continued for another 30 minutes before a saturated NH4Cl solution (Iml) was added. Then the THF was removed in vacuo and water was added to the remaining residue. This mixture was extracted with ether and the combined organic extracts were washed with water and brine and dried (MgSO<sub>4</sub>). After evaporation of the solvent the crude alkylation product (1.46 g) was dissolved in THF (20-ml) and LiOH 25 solution (1M, 14.5 ml) was added. The reaction mixture was stirred overnight, 'concentrated and washed with ether. Then the pH was adjusted to 1 by addition of 3N HCl and the resulting suspension was extracted with ether. Finally the combined extracts were

washed with water and brine, dried (MgSO<sub>4</sub>) and the solvent was removed in vacuo. The product was obtained as a white solid (1.33 g).

MS (ISP): 260.2 (MH<sup>-</sup>).

Step B]: 1,1-Dimethyl-2-(5-methyl-2-phenyl-oxazol-4-yl)-ethylamine

The acid derivative prepared according to step A] (1.32 g) was suspended in toluene and triethylamine (0.71 ml) was added. After 15 min diphenylphosphoryl azide (1.1 ml) was: added and the reaction mixture was refluxed for 2 hours. Then benzyl alcohol (0.79 ml) was added and heating was continued overnight. The mixture was then allowed to cool to RT; diluted with ether and washed with citric acid solution (0.5M); saturated KHCO30solution and brine and was dried (MgSO4). After evaporation of the solvent, the residue . 10 was purified by chromatography (hexane/ethyl acetate 7:1). The pure rearrangement product was than dissolved in ethanol (37 ml), palladium on carbon (10%, 20 mg) was added and the reaction vessel was charged with hydrogen. After 24 hours the catalyst was filtered off and the solvent was removed in vacuo. The product was obtained as light yellow liquid (0.74 g).

MS (ISP): 231.2 (MH<sup>+</sup>).

The title compound was obtained from the amine derivative prepared according to step B (0.74 g) and IIA (0.18 g) following the procedure outlined in example 1. Final chromatography (CH<sub>2</sub>Cl<sub>2</sub>/MeOH 9:1) gave a light yellow gum (0.36 g).

Synthesis of this type of compound required the preparation of the hitherto unknown 6membered sulfimidate reagents XIX for the preparation of amine precursors IIIH - IIIL. In
general, a BOC protected 3-aminopropan-1-ol XX (e.g. made by reduction from
azetidinone XXI) is cyclized with SOCl<sub>2</sub> in the presence of imidazole. The intermediate is
usually not isolated but subsequently oxidized to the BOC protected sulfonic acid
derivative XIX. As the 5 membered sulfimidates IV, these compounds are versatile
alkylating agents that react readily with a variety of nitrogen and carbon based
nucleophiles.

Pyrazole derivatives XXII used for examples 78 – 97 are commercially available or can be accessed *via* pathways A or B known in the literature involving 1,3-diketones XXIII and XXIV as synthetic intermediates. If pyrazoles XXII are treated with strong bases such as potassium-*tert*-butoxide (KO<sup>tert</sup>Bu) or the like followed by a sulfimidate XIX, N-alkylated products XXV-A and XXV-B (mixture of regioisomers) are obtained. Usually, regioisomer XXV-A can be isolated in larger amounts. Treatment of these BOC protected amines with acids such as TFA or the like results in liberation of the free amines IIIH-A and IIIH-B that are used in the coupling reaction with IIA to furnish cyanopyrrolidines I.

Step A]: (3-Hydroxy-1,1-dimethyl-propyl)-carbamic acid tert-butyl ester

4,4-Dimethyl-1-tert-butyloxycarbonyl-azetidine-2-one (32.5 g, synthesized according to Schoen et al., J. Med. Chem. 1994, 37 (7), 897) was dissolved in methanol (450 ml). The solution was cooled to 0° by means of an ice bath and treated with sodium borohydride (18.3 g, 6 portions over 45 minutes). The mixture was allowed to stir for 3 hours at 0°, warmed to room temperature and stirred for another 60 min. The reaction mixture was then poured into a mixture of ice, water and sat. NH<sub>4</sub>Cl solution and extracted with ether. The organic layer was separated, washed with brine, dried over Na<sub>2</sub>SO<sub>4</sub> and evaporated. The residual oil was purified by flash chromatography (gradient of hexanes in ethyl acetate: 7/3 to 1/1). The fractions containing the product were combined, evaporated and dried in vacuo to leave a colorless oil (26.7 g).

WO 03/037327

Step B]: 4,4-Dimethyl-2,2-dioxo-2λ' -[1,2,3]oxathiazinane-3-carboxylic acid tert-butyl ester

Imidazole (53.6 g) was dissolved in CH<sub>2</sub>Cl<sub>2</sub> and cooled to 0° by means of an ice bath.

Thionylchloride (28.1 g) dissolved in 100 ml abs. CH<sub>2</sub>Cl<sub>2</sub> was added drop by drop and the resulting mixture was allowed to warm to RT. Stirring was continued for 60 min at RT and then the mixture was cooled to -78°C. A solution of (3-hydroxy-1,1-dimethyl-propyl)-carbamic acid tert-butyl ester (26.7 g) in 150 ml CH<sub>2</sub>Cl<sub>2</sub> was added over a period of 50 min and the resulting mixture was allowed to warm to RT and stirred for 24 hours. TLC analysis confirmed the complete consumption of the starting material. The mixture was filtered through dicalite and the filter aid was washed well with CH<sub>2</sub>Cl<sub>2</sub>. The organic layer was diluted with CH<sub>2</sub>Cl<sub>2</sub> washed with water and brine, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and concentrated to a volume of approx. 750 ml.

A solution of NaIO<sub>4</sub> (61.2 g) in 620 ml water was added and the mixture was cooled to 0°C. Ru(IV)O<sub>2</sub> hydrate (1.23 g) was added and the black suspension was stirred for 90 min at 0°C. It was then warmed to RT and allowed to stir for another 20 hours. The mixture was filtered through dicalite and the filtrate was extracted with CH<sub>2</sub>Cl<sub>2</sub>. The combined organic layers were washed with brine, dried and filtered. Treatment of the filtrate with activated charcoal (6.9 g) for 30 min removed all traces of Ru. The mixure was filtered again and evaporated to give an oil that was purified by flash chromatography (hexanes/ethyl acetate 9:1 and then 8:2) to give the desired product as a colorless solid (yield: 17.3 g).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): 1.53 (s, 9H), 1.63 (s, 6H), 2.29 (t, *J*=6.8Hz, 2H), 4.62 (t, *J*=6.8Hz, 2H)

Step C]: [1,1-Dimethyl-3-(5-methyl-3-phenyl-pyrazol-1-yl)-propyl]-carbamic acid tert-butyl ester

5-Methyl-3-phenyl-1*H*-pyrazole (320 mg, prepared from benzoylacetone and hydrazine according to Ali *et al.*, *Pak. J. Sci. Ind. Res.* 1993, 36 (12), 502) was dissolved in DMF (7 ml) and cooled to 0°C with an ice bath. Potassium-*tert*-butoxide (284 mg) was added in portions and the mixture was stirred for 45 min at 0°C. Then, 4,4-dimethyl-2,2-dioxo-2λ'-[1,2,3]oxathiazinane-3-carboxylic acid *tert*-butyl ester (617 mg) was added in one portion and the reaction mixture was allowed to stir for 20 hours at RT. HCl (1N aqueous solution, 10 ml) was added and stirring was continued for 15 minutes. The mixture was diluted with ether, washed with water and brine (the aqueous layers were re-extracted twice with ether), dried and evaporated. The crude product was purified by flash

chromatography (0 to 15% gradient of CH<sub>3</sub>CN in CH<sub>2</sub>Cl<sub>2</sub>) to give the desired product as a yellow gum. Yield: 545 mg. A regioisomer present in minor amounts was removed in the chromatographic purification step.

MS (ISP): 344.5 (MH<sup>+</sup>)

5 Step D]: 1,1-Dimethyl-3-(5-methyl-3-phenyl-pyrazol-1-yl)-propylamine

[1,1-Dimethyl-3-(5-methyl-3-phenyl-pyrazol-1-yl)-propyl]-carbamic acid tert-butyl ester (540 mg) was treated with TFA/CH<sub>2</sub>Cl<sub>2</sub> 3:1 (20 ml) at 0 °C for 2 hours. The resulting mixture was concentrated in vacuo and the residue was diluted with ethyl acetate. The organic layer was washed with a mixture of brine/sat. Na<sub>2</sub>CO<sub>3</sub> and brine, dried and evaporated to give a crude oil. This was purified by flash chromatography (5% to 40% gradient of MeOH in CH<sub>2</sub>Cl<sub>2</sub>, 0.5% NH<sub>4</sub>OH content) to give the title compound (349 mg) as a yellow gum.

MS (ISP): 244.5 (MH<sup>+</sup>)

Step E]: (2S)-1-{[1,1-Dimethyl-3-(5-methyl-3-phenyl-pyrazol-1-yl)-propylamino]-acetyl}-pyrrolidine-2-carbonitrile, methanesulfonic acid salt

1,1-Dimethyl-3-(5-methyl-3-phenyl-pyrazol-1-yl)-propylamine (344 mg) was dissolved in dry DMF (7 ml) under argon and calcium hydroxide (95 mg) was added. A solution of 222 mg (S)-1-(2-chloro-acetyl)-pyrrolidine-2-carbonitrile (IIA) in DMF (7 ml) was added within 5 hours by means of a syringe pump and the resulting cloudy mixture was allowed to stir for 3 days. The mixture was poured into 1N NaOH and extracted with ether. The organic layer was washed with 1N NaOH and brine, dried and evaporated. The residue was purified by flash chromatography using a gradient of MeOH in CH<sub>2</sub>Cl<sub>2</sub> (0 to 15%) to give the title compound as the free base (281 mg). For salt formation, 92 mg of this material were dissolved in abs. tert-butylmethyl ether (6 ml). To this solution was added methanesulfonic acid (2.42 ml, 0.1 M in tert-butylmethyl ether) drop by drop. The resulting suspension was stirred at RT for 30 min and then filtered. The title compound thus obtained was dried in vacuo. Yield: 101 mg.

Step A]: 5-Methyl-3-(3-trifluoromethyl-phenyl)-1H-pyrazole

Ethyl acetate (2.45 ml) was added to THF (50 ml) and treated with sodium hydride (1.09 g, 60% dispersion in oil) under argon. A catalytic amount of ethanol (2 drops) was added followed by dibenzo-18-crown-6 (90 mg) and 3-trifluoromethylacetophenone (2.35 g) dissolved in THF (20 ml), added over a period of 20 min. The brown mixture was heated to reflux for 2 hours, cooled and poured into water. The pH was adjusted to 5 to 6 with 2N HCl and 2N Na<sub>2</sub>CO<sub>3</sub>, respectively. The aqueous phase was extracted with ethyl acetate and the organic layer was washed with brine, dried and evaporated to give the intermediate 1,3-dicarbonyl compound as an orange solid.

This material was dissolved in ethanol/water 1:1 (50 ml) and treated with hydrazine monohydrate (0.8 ml). The mixture was refluxed for 3 hours, cooled and poured into water. The pH was adjusted to 8-9 with Na<sub>2</sub>CO<sub>3</sub> solution (2M) and the aqueous layer was then extracted with ethyl acetate. The organic layers were washed with brine, dried and evaporated to give a crude oil. This was purified by flash chromatography (gradient of hexanes in ethyl acetate) to give the title compound as a light yellow solid (1.4 g).

This compound known previously in the literature was made in analogy to Katsuyama et al., Synthesis 1997, 1321: 3-Acetyl-pyridine (1:21 g) was dissolved in benzene (10 ml) and potassium-tert butoxide (1.35 g) was added under argon. The suspension was cooled to 0°C and trifluoroacetic acid ethyl ester (1.43 ml) was added drop by drop. The color and the texture of the suspension changed within 10 min and the resulting mixture was allowed to stir at RT for 60 min. Water (50 ml) was added and the solids were dissolved. Acetic acid (2.5 ml) was added and a yellow precipitate was observed. Ethyl acetate was added and the material was partly soluble in the organic layer. The clear aqueous layer was separated and the suspension in the organic layer was concentrated in vacuo. The residue was suspended in ethanol/water 1:1 (50 ml) and treated with hydrazine monohydrate (0.61 ml). The solution was heated to reflux and gradually cleared to become a clear solution. Acetic acid (2 ml) was added and heating was continued for 5 h. The solution was then cooled, poured into brine and basified with saturated Na2CO3 solution. The aqueous layer was extracted with ethyl acetate and the organic layer was separated, washed with brine, dried and evaporated to give a crude product. This solid was triturated with ether (5 ml) for 30 min and filtered. The resulting solid was dried in vacuo. (Yield: 1.4 g).

This compound is accessible in analogy to the synthesis of the pyrazol type amines IIIH by replacing the pyrazole starting materials XXII with [1,2,4]triazoles XXVI. [1,2,4]triazoles XXVI used in examples 98 – 100 are commercially available, known in the literature or were prepared in analogy to literature procedures. Hydrazine monohydrate (0.34 ml) was dissolved in ethanol (6 ml). Ethyl trifluoroacetate (0.83 ml) was added dropwise over a period of 15 min at 0°C and the resulting mixture was allowed to stir for 90 min at 0°C. The solution was concentrated to about 20% of the initial volume in vacuo at 35°C and the trifluoroacetic acid hydrazide obtained that way was used without further purification.

Nicotinamidine hydrochloride (1.5 g) was suspended in ethanol (8 ml) and a suspension of sodium methoxide (514 mg) in 4 ml ethanol was added slowly. The resulting suspension was allowed to stir for 60 min at RT and then filtered. To the filtrate was added the ethanolic solution of trifluoroacetic acid hydrazide made previously by syringe and the syringe was washed with a small amount of ethanol. The resulting solution is then allowed to stir at RT for 4 days under argon. A 1:1 mixture of ether and hexanes (approx. 25 ml) was added to the solution and the solvent was decanted from an oily precipitate and concentrated in vacuo to leave crude trifluoroacetic acid N'-(imino-pyridin-3-yl-methyl)-hydrazide (759 mg) as a semisolid.

This material was treated in analogy to the literature (Evans et al., US Patent 4,038,405, 1977) with 3N NaOH solution (12 ml) under reflux for 1.5 h and the resulting mixture was allowed to stir at RT over night. The suspension was filtered and the solid was washed with cold water and dried in vacuo. The residue was triturated with hexanes (10 ml), filtered and dried to give the title compound as a colorless solid (180 mg).

Synthesis of this compound required the preparation of an amine derivative IIIQ as outlined in the scheme above. Amines IIIQ are synthetically accessible by cyclization of an amidine derivative XXXVI with an N-protected 4-oxo-pentylamine derivative XXXVI activated at the primary 5-position. A suitable N-protecting group is for example the phthalimido group that can be cleaved by treatment with hydrazine. Amidines XXXVI are known in the literature or can be readily prepared from the corresponding nitrile derivatives employing standard methodologies as e. g. the Pinner reaction. Preparations of N-protected 4-oxo-pentylamines XXXVII are described for example in Schunack, W. et al. Z. Naturforschung 1987, 42B, 238-242.

Step A]: 2-[3-(2-Phenyl-1H-imidazol-4-yl)-propyl]-isoindole-1,3-dione

To a solution of 2-(5-bromo-4-oxo-pentyl)-isoindole-1,3-dione [CAS 41306-64-3](12.4 g) in abs. DMF (50 ml) was added benzamidine 85 % (5.65 g) and potassium carbonate (11.05 g). The reaction mixture was stirred at 80 °C for 4h, concentrated under high vacuum, quenched with water and extracted with ethyl acetate. The organic phase was washed with ice/water and brine, dried over magnesium sulphate and concentrated. The residue was purified by chromatography on silica gel using methylene chloride/methanol 2 and 5 % as eluent. The product fractions were combined and evaporated to dryness to obtain 2-[3-(2-phenyl-1H-imidazol-4-yl)-propyl]-isoindole-1,3-dione (8.95 g) as a light yellow foam.

Synthesis of this compound required the preparation of an amine of type IIIR which is accessible from imidazoles XXXVIII via azide formation and reduction. Azide derivatives can be obtained by substitution reactions of XXXVIII with azides using e.g. metal azides or a Mitsunobu protocol-Reduction of azides is well-known in literature to be accomplished by e.g. hydrogenation or Staudinger reaction. Imidazoles XXXVIII are commercially available or can be prepared in analogy to the procedures described in WO 96/10018.

10 Step A]: 4-Azidomethyl-5-methyl-2-phenyl-1H-imidazole

To a solution of 4-chloromethyl-5-methyl-2-phenyl-1H-imidazole hydrochloride (4.86 g) [CAS 58731-95-6] in DMF (50 ml) was added sodium azide (7.79 g). The reaction mixture was stirred at room temperature for 18h under argon and concentrated without heating under high vacuum. To the residue was added ice/1 molar  $K_2CO_3$  solution, and the mixture was extracted with ethyl acetate. The organic phase was washed with brine, dried over magnesium sulphate and concentrated. The residue was purified by chromatography on silica gel using methylene chloride/methanol 2 % as eluent to obtain 4 -azidomethyl-5-methyl-2-phenyl-1H-imidazole (3.70 g) as a light yellow amorphous powder.

Step B]: <u>C</u>-(5-Methyl-2-phenyl-1H-imidazol-4-yl)-methylamine

To solution of 4 -azidomethyl-5-methyl-2-phenyl-1H-imidazole (1.22 g) in ethanol (50 ml) was added 10 % Pd/C (0.10 g). The reaction mixture was hydrogenated at room temperature and 1.1 bar for 30 minutes, the catalyst was filtered off over a pad of celite. The filtrate was evaporated to dryness under high vacuum to obtain C-(5-methyl-2-phenyl-1H-imidazol-4-yl)-methylamine (1.06 g) as a light yellow foam which was sufficiently pure to be used directly in the next step.

To a solution of C-(5-methyl-2-phenyl-1H-imidazol-4-yl)-methylamine (1.12 g) in abs. THF (60 ml) was added IIA (0.345 g) in analogy to example 1. The reaction mixture was stirred at room temperature for 20h, concentrated under vacuum. The residue was quenched with brine and conc. NaOH solution/ice and extracted with ethyl acetate. The organic phase was washed with brine, dried over magnesium sulphate and concentrated, the residue was purified by chromatography on silica gel using methylene chloride/methanol 5 % and 10 % as eluent to obtain the title compound (0.32 g) as a light yellow foam.

Synthesis of this compound required the preparation of an amine derivative IIIS. This could be achieved as outlined in the scheme above by cyclization of an amidine derivative XXXVI with an N-protected 4-oxo-pentylamine XXXIX activated at the 3-position. A suitable N-protecting group is for example the phthalimido group that can be cleaved by treatment with hydrazine. Arylamidines XXXVI are known in the literature or can be readily prepared from the corresponding nitrile derivatives employing standard methodologies as e. g. the Pinner reaction. Preparations of N-protected 4-oxo-pentylamines XXXIX are described in Schunack, W. et al. Z. Naturforschung 1987, 42B, 238-242.

To a solution of 2-(3-bromo-4-oxo-pentyl)-isoindole-1,3-dione (12.4 g) [CAS 112357-34-3] in abs. DMF (50 ml) was added benzamidine 85 % (5.65 g) and potassium carbonate (11.03 g). The reaction mixture was stirred at 80 °C for 4h, concentrated under vacuum. To the residue was added ice/water, and the mixture was extracted with ethyl acetate. The organic phase was washed with water and brine, dried over magnesium sulphate and concentrated. The crude product was purified by chromatography on silica gel using methylene chloride/methanol 5 % and 10 % as eluent to obtain 2-[2, 5-methyl-2-phenyl-1H-imidazol-4-yl)-ethyl]-isoindole-1,3-dione (5.5 g) as a yellow foam.

Synthesis of the title compound required the preparation of the corresponding amine precursor IIIT. A possible synthetic sequence is described in the general scheme above. Imidazoles XL could be prepared from amidines XXXVI by reaction with 2,3-butadione or 1,3-dihydroxyacetone as described in WO 96/10018 or in DE2528640. Chlorination and reaction with aliphatic nitro compounds under basic conditions (as for example described in Eur. J. Med. Chem. 1995, 30, 219-225) yielded the nitro derivatives XLI. Prior to the final reduction to the amine derivatives IIIT an N-alkylation step is optionally.

Step A]:[2-(3-Fluoro-4-methyl-phenyl)-5-methyl-1H-imidazol-4-yl]-methanol, hydrochloride

To a solution of 3-fluoro-4-methylbenzamidine hydrochloride (5.65 g) [CAS 175277-88-0] in isopropanol (75 ml) was added at 80 °C 2,3-butanedione (3.22 g) [CAS 431-03-8, commercially available]. After the reaction mixture had been stirred under reflux for 48 h, it was concentrated and the resulting residue was taken up in 3 molar HCl (80 ml) and

refluxed again for 3h. Then the reaction mixture was concentrated almost to dryness. To the remaining residue acetone (100 ml) was added and the mixture was cooled to 0°C. The precipitate formed was filtered, washed with a small amount of cold acetone and ether and dried under high vacuum to obtain 2-(3-fluoro-4-methyl-phenyl)-5-methyl-1H-imidazol-4-yl]-methanol hydrochloride (6.7 g) as an off-white solid.

Step B]:2-(3-Fluoro-4-methyl-phenyl)-5-methyl-4-(2-methyl-2-nitro-propyl)-1H-imidazole

To a suspension of 2-(3-fluoro-4-methyl-phenyl)-5-methyl-1H-imidazol-4-yl]-methanol hydrochloride (4.87 g) in toluene (45 ml) was added dropwise in 15 minutes at 45 °C thionyl chloride (14.1 g) dissolved in toluene (5 ml). The reaction mixture was stirred half an hour at 65 °C and 2h at RT, ether (200 ml) was added, the precipitate filtered off and dried. The crude dry residue (5.12 g) was dissolved in methanol (25 ml) and added dropwise within 15 minutes at 20-25 °C to a mixture of 2-nitropropane (5.4 g) and 1 molar sodium methylate/methanol (46 ml). The reaction mixture was stirred at RT for 3h, concentrated under vacuum without heating, the residue quenched with ice/brine and extracted with ethyl acetate. The organic phase was washed with brine, dried over magnesium sulphate and concentrated. The residue was triturated with methylene chloride/ether, cooled down and the solid filtrated. The filter cake was washed with ether and dried to obtain 2-(3-fluoro-4-methyl-phenyl)-5-methyl-4-(2-methyl-2-nitro-propyl)-1H-imidazole (4.2 g) as a off-white solid.

The active ingredient is sieved and mixed with microcristalline cellulose and the mixture is granulated with a solution of polyvinylpyrrolidon in water. The granulate is mixed with sodium starch glycolate and magesiumstearate and compressed to yield kernels of 120 or 350 mg respectively. The kernels are lacquered with an aqueous solution / suspension of the above mentioned film coat.

- a) pyridinyl or pyrimidinyl, which is substituted with 1 to 3 substituents independently selected from the group consisting of aryl and heteroaryl, which aryl or heteroaryl group can optionally be substituted with 1 to 3 substituents independently selected from the group consisting of lower-alkyl, lower-alkoxy, halogen, CN, and CF<sub>3</sub>, or b) 5-membered heteroaryl or bi- or tricyclic heterocyclyl, which 5-membered heteroaryl or bi- or tricyclic heterocyclyl can optionally be substituted with 1 to 3 substituents independently selected from the group consisting of lower-alkyl, carbonyl, aryl and heteroaryl, which aryl or heteroaryl group can optionally be substituted with 1 to 3 substituents independently selected from the group consisting of lower-alkyl, lower-6 alkoxy, halogen, CN, and CF<sub>3</sub>, and which carbonyl group can optionally be substituted with lower-alkyl, lower-alkoxy, halogen, CN, CF<sub>3</sub>, aryl, or heteroaryl, which aryl or heteroaryl group can optionally be substituted with 1 to 3 substituents independently selected from the group consisting of lower-alkyl, lower-alkoxy, halogen, CN, and CF<sub>3</sub>, and R<sup>3</sup> are as defined in claim 1.
  - 10. Compounds according to claim 9, wherein R<sup>6</sup> is
- a) pyridinyl or pyrimidinyl, which is substituted with 1 to 3 substituents independently selected from the group consisting of pyridinyl, oxadiazolyl, and phenyl, which oxadiazolyl can optionally be substituted with lower-alkyl, and which phenyl can optionally be substituted with 1 to 3 substituents independently selected from the group consisting of lower-alkyl, lower-alkoxy, CN, and CF<sub>3</sub>, or
- b) thiazolyl or oxadiazolyl, which can optionally be substituted with 1 to 3 substituents independently selected from the group consisting of lower-alkyl, phenyl, benzoyl, phenyl-isoxazolyl and pyridyl, which pyridyl can optionally be substituted with lower-alkyl or halogen, and which phenyl can optionally be substituted with 1 to 3 substituents independently selected from the group consisting of lower-alkoxy, halogen, CN, and CF<sub>3</sub>, c) 8H-indeno[1,2-d]thiazolyl, 4,5,6,7-tetrahydro-benzothiazolyl, 4,5,6,7-tetrahydro-thiazolo[5,4-c]pyridinyl, benzothiazolyl, benzooxazolyl or 1H-benzoimidazolyl, which 1H-benzoimidazolyl can optionally be substituted with lower-alkyl, and which 4,5,6,7-tetrahydro-thiazolo[5,4-c]pyridinyl can optionally be substituted with lower-alkyl-carbonyl or lower-alkoxy-carbonyl,
- 11. Compounds according to claim 10, wherein R<sup>6</sup> is selected from the group
  35 consisting of

and R<sup>3</sup> and R<sup>4</sup> independently from each other are hydrogen or lower-alkyl.

#### INTERNATIONAL SEARCH REPORT

Box i Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)
This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:
1. X Claims Nos.: 26-28 because they relate to subject matter not required to be searched by this Authority, namely:
see FURTHER INFORMATION sheet PCT/ISA/210
Claims Nos.:     because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. Ctaims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).
Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)
This international Searching Authority found multiple inventions in this international application, as follows:
As all required additional search fees were timely paid by the applicant, this international Search Report covers all searchable claims.
2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. As only some of the required additional search fees were timely paid by the applicant, this international Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:
Remark on Protest  The additional search fees were accompanied by the applicant's protest.
No protest accompanied the payment of additional search fees.
